

## WHAT IS

# FINE PARTICULATE MATTER (PM<sub>2.5</sub>)?

**Fine Particulate Matter** (also known as **PM<sub>2.5</sub>**) are particles in the air that measure less than 2.5 micrometers (µm) in diameter, and typically consists of a mix of things like smoke, soot, liquid or solid particles in aerosol, or biological matter like mould, bacteria, pollen and animal dander. **PM<sub>2.5</sub>** poses a risk to your health because, when inhaled, it can travel deeply into your lungs.

## INFILTRATION FROM OUTDOORS

Vehicle emissions

Industry

Wood burning

## WHO IS AT GREATEST RISK?

- People with existing lung and heart conditions
- Children
- Seniors

## HEALTH EFFECTS OF PM<sub>2.5</sub>

Eye, nose, throat and lung irritation

Decreased lung function

Wheezing, coughing and shortness of breath

Aggravation of lung and heart conditions like asthma and heart disease

## HOW TO REDUCE YOUR RISK?

- **Remove and control sources**
  - Keep your home smoke free.
  - Ensure fuel burning appliances are properly installed and maintained.
  - Move dusty work outside.
  - Use a vacuum with a high efficiency particulate air (HEPA) filter.
  - Reduce the use of candles and incense.
  - Do not idle your vehicle in your garage or near entrances to your home.
- **Ventilate your home**
  - Open windows.
  - If you have a mechanical ventilation system, use it to bring in fresh air.
- **Filter the air** with an in-duct filter for your furnace or a portable air cleaner with a HEPA filter
- **Use range hood on highest setting when cooking**

On days when **OUTDOOR POLLUTION**

is **high**, opening windows might not improve the **air quality** indoors.
