

# FLUWATCH

February 13 to February 19, 2022  
(Week 07)

## Weekly Highlights

- Influenza activity across Canada has decreased in recent weeks and remains low for this time of year. Low numbers of sporadic detections of influenza continue to be reported. There has been no evidence of community circulation of influenza in the 2021-2022 season to date.

### Virologic

- In week 07, a total of 2 influenza detections (2 influenza A and 0 influenza B) were reported.
- The number of laboratory detections of influenza continues to decrease since peaking in late December.

### Syndromic

- The percentage visits for influenza-like illness (ILI) was 0.8% in week 07. The percentage of visits for ILI has decreased in recent weeks since peaking in early January.
- The percentage of FluWatchers reporting fever and cough was 0.4% in week 07. The percentage of participants reporting cough and fever has continued to decrease week to week since peaking in late December.

### Outbreaks

- In week 07, one ILI outbreak was reported.
- From August 29, 2021 to February 19, 2022 (weeks 35 to 07), 18 ILI outbreaks and no laboratory-confirmed influenza outbreaks have been reported.

### Severe Outcomes

- From August 29, 2021 to February 19, 2022 (weeks 35 to 07), less than five influenza-associated hospitalizations have been reported from participating provinces and territories.

### Other Notes

- The 2021-2022 Seasonal Influenza Immunization Coverage Survey showed that 30% of adults aged 18-64 years and 71% of seniors aged 65 years and older received the influenza vaccine in Canada. These results are similar to previous seasons.
- The [World Health Organization](#) has released its recommended composition of the northern hemisphere influenza vaccine for use in the 2022-2023 season.

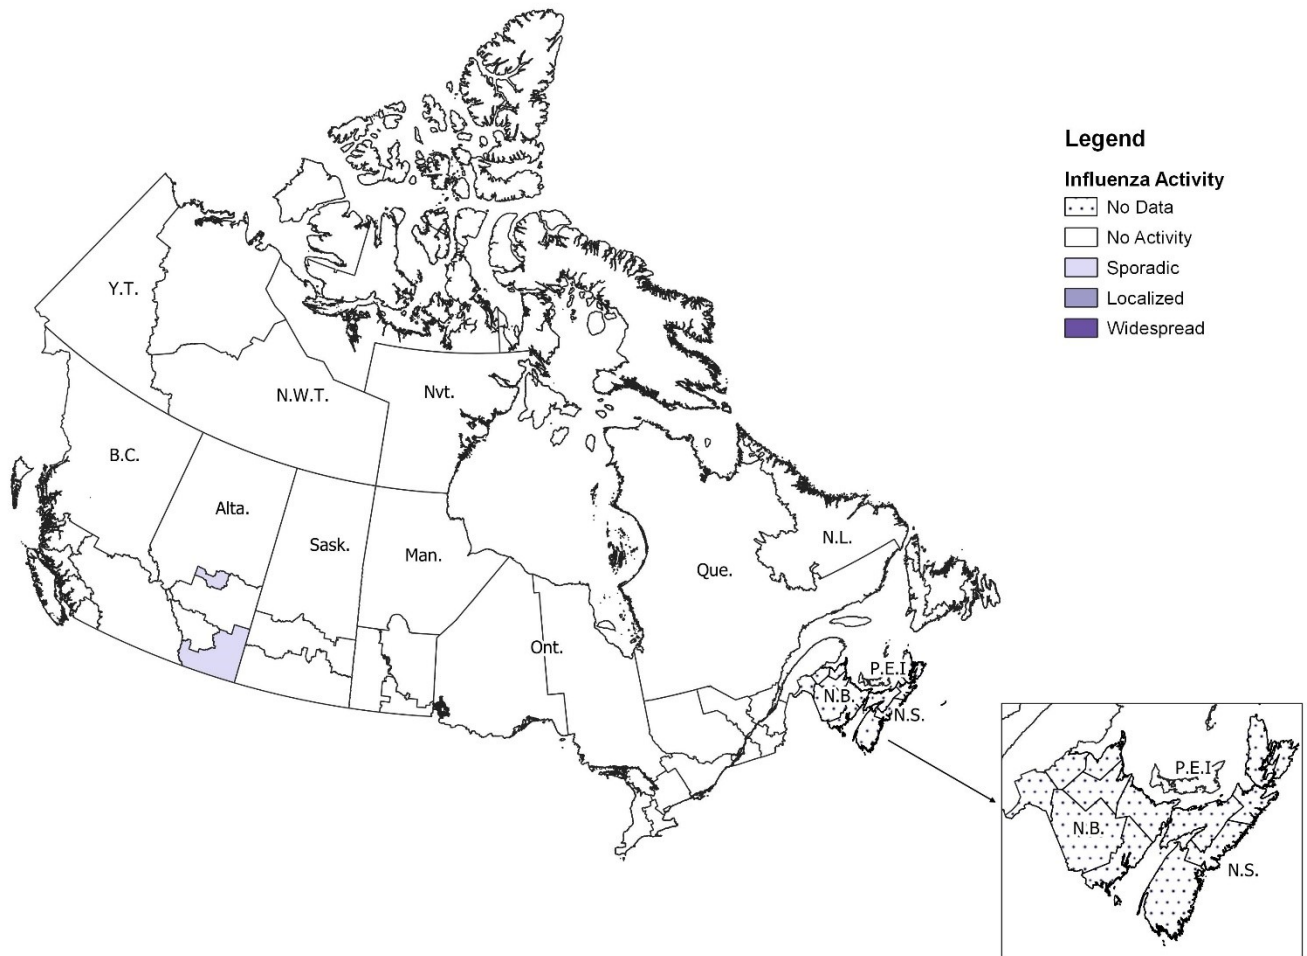

# Influenza/Influenza-like Illness Activity – Geographic Spread

In week 07, two regions in one province (Alta.) reported sporadic influenza/ILI activity. All other surveillance regions reported no influenza/ILI activity (Figure 1).

**Figure 1 – Map of influenza/ILI activity by province and territory, Canada, week 2022-07**

Number of Regions Reporting in Week 07: 42 out of 53

## Laboratory-Confirmed Influenza Detections

In week 07, two laboratory detections of influenza A were reported.

Overall, the percentage of laboratory tests positive for influenza remains at exceptionally low levels, despite continued testing at levels similar to previous seasons. In week 07, 11,821 tests for influenza were performed at reporting laboratories and the percentage of tests positive for influenza was 0.02%. Compared to the past six pre-pandemic seasons (2014-2015 to 2019-2020), an average of 10,842 tests were performed for this time period, with an average of 25% of tests positive for influenza (Figure 3).

To date this season (August 29, 2021 to February 19, 2022), 508 influenza detections (394 influenza A and 114 influenza B) have been reported, which is lower than what we have seen historically in the past six pre-pandemic seasons, where an average of 29,877 influenza detections were reported at this point in the season. Among subtyped influenza A detections (112), influenza A(H3N2) accounted for 93% of detections.

Detailed information on age and type/subtype has been received for 399 laboratory-confirmed influenza detections (Figure 4). Among the 399 detections, 326 (82%) were in individuals under the age of 45.

Testing for influenza and other respiratory viruses has been influenced by the current COVID-19 pandemic. Changes in laboratory testing practices may affect the comparability of data to previous weeks or previous seasons.

For more detailed weekly and cumulative influenza data, see the text descriptions for [Figures 2 and 3](#) or the [Respiratory Virus Detections in Canada Report](#).

**Figure 2 – Number of positive influenza tests and percentage of tests positive, by type, subtype and report week, Canada, week 2022-07**

Number of Laboratories Reporting in Week 07: 31 out of 34

For one province, only data from subtyped influenza A specimens are included in the weekly number of positive influenza tests in Figure 2. The number of positive tests reported in Figure 2 may not equal the total number of positive tests in the report body text.

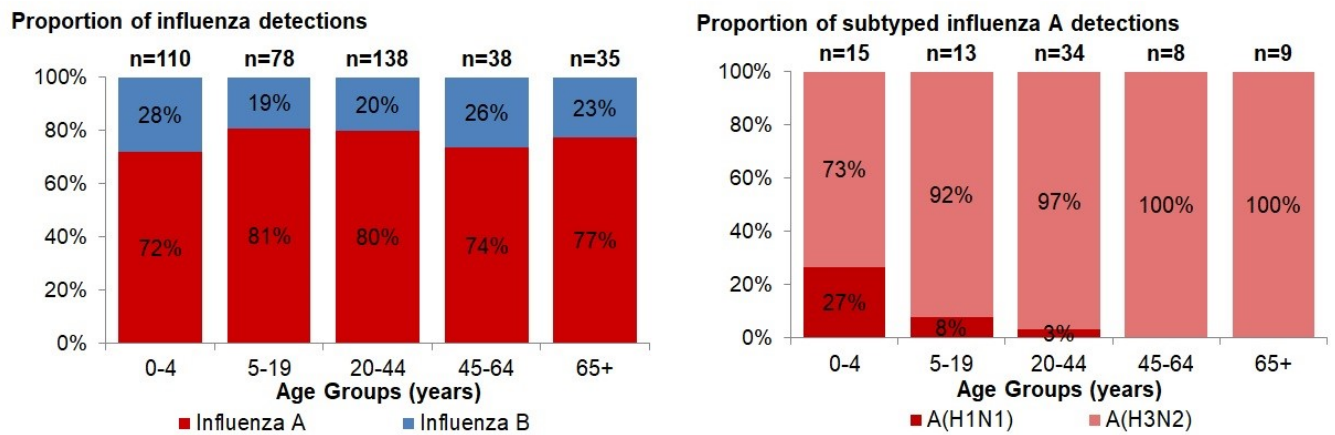

**Figure 3 – Number of influenza tests and percentage of tests positive in Canada compared to previous seasons, week 2022-07**

The shaded area represents the maximum and minimum number of influenza tests or percentage of tests positive reported by week from seasons 2014-2015 to 2019-2020. Data from week 11 of the 2019-2020 season onwards are excluded from the historical comparison due to the COVID-19 pandemic.

Included in the cumulative detections this season are 11 co-infections of influenza A and B (total of 22 detections) that were suspected to be associated with [live attenuated influenza vaccine \(LAIV\)](#) receipt. Beginning in week 44 co-infections known or reported to be associated with recent LAIV were removed by the submitting laboratory or by the Public Health Agency of Canada as they do not represent community transmission of seasonal influenza viruses.

**Figure 4 – Proportion of positive influenza specimens by type or subtype and age-group reported through case-based laboratory reporting, Canada, weeks 2021-35 to 2022-07**

# Syndromic / Influenza-like Illness Surveillance

## Healthcare Practitioners Sentinel Surveillance

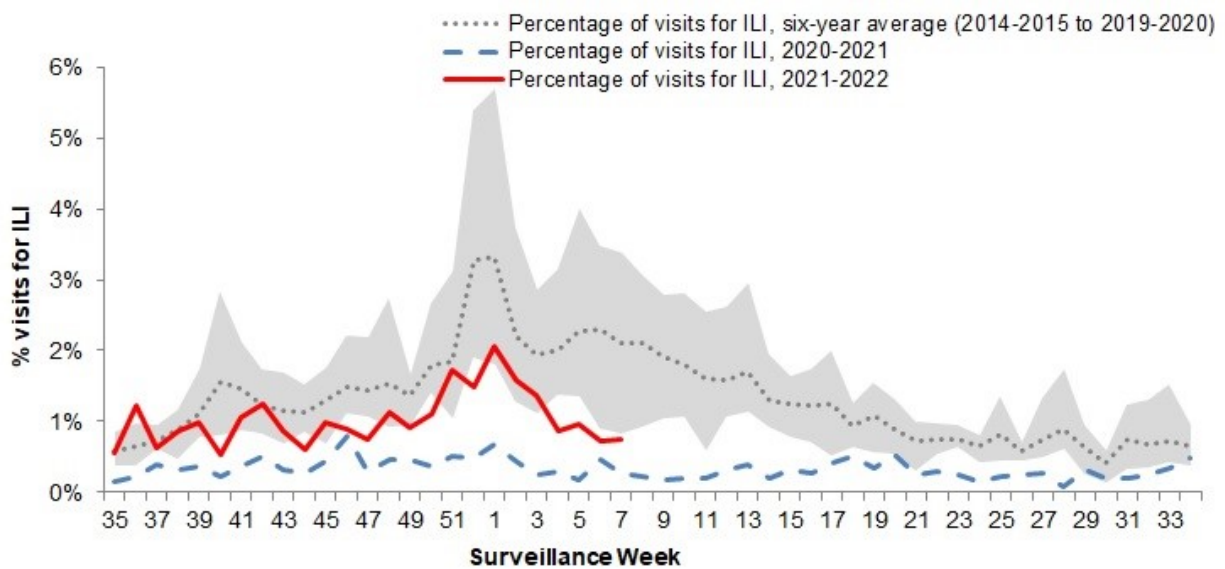

In week 07, 0.8% of visits to healthcare professionals were due to influenza-like illness (ILI).

Since the beginning of the surveillance season, the percentage of visits for ILI has been within or near expected pre-pandemic levels (Figure 5). ILI symptoms are not specific to any one respiratory pathogen and can be due to influenza, or other respiratory viruses, including respiratory syncytial virus and even SARS-CoV-2, the virus that causes COVID-19.

This indicator should be interpreted with caution as there have been changes in healthcare seeking behavior of individuals and a smaller number of sentinels reporting compared to previous seasons.

**Figure 5 – Percentage of visits for ILI reported by sentinels by report week, Canada, weeks 2021-35 to 2022-07**

Number of Sentinels Reporting in Week 07: 50

The shaded area represents the maximum and minimum percentage of visits for ILI reported by week from seasons 2014-2015 to 2019-2020. Data from week 11 of the 2019-2020 season onwards are excluded from the historical comparison due to the COVID-19 pandemic.

## FluWatchers

In week 07, 12,006 participants reported to FluWatchers, of which 0.42% reported symptoms of cough and fever (Figure 6). The percentage of participants reporting cough and fever peaked in late December and has decreased to levels seen in the fall.

The reports of cough and fever are not specific to any one respiratory pathogen and can be due to influenza, or other respiratory viruses, including respiratory syncytial virus, rhinovirus, and even SARS-CoV-2, the virus that causes COVID-19. FluWatchers reporting is not impacted by changes in health services or health seeking behaviours.

Among the 50 participants who reported cough and fever:

- 70% consulted a healthcare professional;
- 82% reported days missed from work or school, resulting in a combined total of 248 missed days of work or school (average of 4.0 days).

The Northwest Territories had the highest participation rate this week (53 participants per 100,000 population) and the neighbourhood of KOA had the highest number of participants (145). See what is happening in your [neighbourhood](#)! Downloadable datasets are also available on [Open Maps](#).

If you are interested in becoming a [FluWatcher](#), [sign up today](#).

**Figure 6 – Percentage of FluWatchers reporting cough and fever, Canada, week 2022-07**

Number of Participants Reporting in Week 07: 12,006

The shaded area represents the maximum and minimum percentage of percentage of participants reporting cough and fever by week, from seasons 2014-2015 to 2019-2020. Data from week 11 of the 2019-2020 season onwards are excluded from the historical comparison due to the COVID-19 pandemic

## Influenza Outbreak Surveillance

In week 07, one ILI outbreak in a school/daycare was reported.

To date this season (August 29, 2021 to February 19, 2022), 18 ILI outbreaks and no laboratory-confirmed influenza outbreaks have been reported. All ILI outbreaks have been reported in schools and/or daycares. The most recent laboratory-confirmed influenza outbreak occurred in week 24 (week ending June 13, 2020) of the 2019-2020 season.

Outbreaks of ILI are not specific to any one respiratory pathogen and can be due influenza, or other respiratory viruses, including respiratory syncytial virus, rhinovirus, and even COVID-19. Many respiratory viruses in addition to the flu commonly circulate during the fall and winter, and can cause clusters of cases with respiratory illness which could be captured as ILI. For more information on the respiratory viruses currently circulating in Canada, please refer to the [Respiratory Virus Detections in Canada](#).

Number of provinces and territories<sup>1</sup> reporting in week 07: 11 out of 13

<sup>1</sup>All Provinces and Territories (PTs) participate in the FluWatch outbreak surveillance system. This outbreak system monitors influenza and ILI outbreaks in long-term care facilities (LTCF), acute care facilities, schools and daycares, remote and/or isolated communities, and facilities categorized as 'other'. Not all reporting PTs report outbreaks in all these settings. All PTs report laboratory confirmed outbreaks in LTCF. Four PTs (NB, NL, NS and YK) report ILI outbreaks in schools and/or daycares and other facilities.

## Influenza Severe Outcomes Surveillance

### Provincial/Territorial Influenza Hospitalizations and Deaths

In week 07, no influenza-associated hospitalizations were reported by participating provinces and territories<sup>2</sup>.

To date this season (August 29, 2021 to February 19, 2022), less than five influenza-associated hospitalizations were reported by participating provinces and territories with the most recent influenza-associated hospitalization reported in week 52 (week ending January 1, 2022).

Number of provinces and territories reporting in week 07: 7 out of 9

<sup>2</sup>Influenza-associated hospitalizations are reported by Alberta, Manitoba, New Brunswick, Newfoundland and Labrador, Northwest Territories, Nova Scotia, Prince Edward Island and Yukon. Only hospitalizations that require intensive medical are reported by Saskatchewan.

### Pediatric Influenza Hospitalizations and Deaths

In week 07, no influenza-associated pediatric ( $\leq 16$  years of age) hospitalizations were reported by the Immunization Monitoring Program Active (IMPACT) network.

To date this season (August 29, 2021 to February 19, 2022), seven pediatric influenza-associated hospitalizations and less than five intensive care unit (ICU) admissions were reported by the IMPACT network.

### Adult Influenza Hospitalizations and Deaths

In week 07, no influenza-associated adult ( $\geq 16$  years of age) hospitalizations were reported by the Canadian Immunization Research Network (CIRN) Serious Outcomes Surveillance (SOS) network.

To date this season (August 29, 2021 to February 19, 2022), less than five influenza-associated adult ( $\geq 16$  years of age) hospitalizations have been reported by the CIRN SOS network.

## Influenza Strain Characterization

To date this season (August 29, 2021 to February 19, 2022), the National Microbiology Laboratory (NML) has characterized 41 influenza viruses (39 A(H3N2), 2 A(H1N1)) received from Canadian laboratories.

### Influenza A(H3N2)

#### Genetic Characterization

Among the 39 influenza A(H3N2) viruses genetically characterized, sequence analysis of the HA gene of these viruses showed that they all belonged to genetic group 3C.2a1b.2a2.

A/Cambodia/e0826360/2020 (H3N2)-like virus is the influenza A(H3N2) component of the 2021-2022 Northern Hemisphere seasonal influenza vaccine and belongs to genetic group 3C.2a1b.2a1.

A/Darwin/6/2021 (H3N2)-like virus is the influenza A(H3N2) component of the 2022 Southern Hemisphere seasonal influenza vaccine and belongs to the genetic group 3C.2a1b.2a2.

#### Antigenic Characterization

Among the 39 A(H3N2) viruses characterized:

- 6 viruses were antigenically similar to A/Cambodia/e0826360/2020 (H3N2)-like virus
- 33 showed reduced titers with antisera raised against egg-grown A/Cambodia/e0826360/2020 (H3N2)-like virus.

### Influenza A(H1N1)

#### Antigenic Characterization

Among the two A(H1N1) viruses characterized:

- One H1N1 virus characterized was antigenically similar to A/Wisconsin/588/2019.
- One H1N1 showed reduced titer with ferret antisera raised against cell culture-propagated A/Wisconsin/588/2019

A/Wisconsin/588/2019 is the influenza A(H1N1) component of the 2021-2022 Northern Hemisphere seasonal influenza vaccine.

## Antiviral Resistance

The NML also tests influenza viruses received from Canadian laboratories for antiviral resistance.

### Oseltamivir

41 influenza viruses (39 A(H3N2) and 2 A(H1N1)) were tested for resistance to oseltamivir:

- All influenza viruses were sensitive to oseltamivir.

### Zanamivir

41 influenza viruses (39 A(H3N2) and 2 A(H1N1)) were tested for resistance to zanamivir:

- All influenza viruses were sensitive to zanamivir.

# Influenza Vaccine Monitoring

Vaccine monitoring refers to activities related to the monitoring of influenza vaccine coverage and effectiveness.

## Vaccine Coverage

The Seasonal Influenza Immunization Coverage Survey is an annual telephone survey conducted between January and February that collects information from Canadians on whether they received the annual seasonal influenza vaccine that season. Vaccine coverage is measured as the percentage of people who reported receiving the influenza vaccine in a specific influenza season.

In the 2021-22 influenza season, coverage was similar to the 2020-21 season at:

- 30% among adults aged 18 to 64 years.
  - 27% among adults aged 18-64 without chronic medical conditions.
  - 38% among adults aged 18-64 with chronic medical conditions.
- 71% among seniors (aged 65 years and older).

**Table 1 – Influenza vaccine coverage among adults (n=3,502)\* by risk group† and gender‡, Seasonal Influenza Vaccination Coverage Survey, Canada, September 2021 – February 2022**

Age group (years)	All		Male		Female	
	N	Vaccine Coverage % (95% CI)	N	Vaccine Coverage % (95% CI)	N	Vaccine Coverage % (95% CI)
All adults (≥18)	3487	38.7 (36.9-40.6)	1548	33.4 (30.8-36.0)	1914	43.9 (41.3-46.5)
18-64	2389	30.1 (28.0-32.2)	1079	24.9 (22.1-27.8)	1286	35.0 (31.9-38.1)
with chronic medical conditions	713	37.6 (33.6-41.7)	298	37.0 (31.0-43.1)	407	38.3 (32.9-43.8)
without chronic medical conditions	1658	26.8 (24.4-29.2)	769	19.9 (16.9-23.0)	873	33.7 (29.9-37.4)
≥65	1098	71.0 (68.1-74.0)	469	67.0 (62.2-71.8)	628	74.6 (70.9-78.3)

\*18 people did not recall whether they had received the influenza vaccine and were excluded from coverage estimates.

†11 people who were 18-64 years old did not disclose whether they had any chronic medical conditions (CMC) and were excluded from stratified analysis.

‡11 people did not disclose their gender and 9 people did not identify as male or female. They were excluded from stratified analysis.

## Vaccine Effectiveness

Within season influenza vaccine effectiveness (VE) estimates are typically available in February or March of each year. Given the low influenza circulation this season to date, VE estimates will not be available for the 2021-2022 season.
