

Hepatitis B in Canada: 2020 surveillance data update

In 2020, **3,004 cases**¹ of hepatitis B (acute, chronic, and unspecified combined) were reported across Canada for a rate² of 8.2 per 100,000 people.

The COVID-19 pandemic reduced the demand for and access to services related to sexually transmitted and blood-borne infections, including testing. This likely impacted new hepatitis B diagnosis rates in 2020, by artificially reducing them.

Acute hepatitis B

(infections lasting up to six months)

National reported acute hepatitis B rates were stable from 2012 to 2019. In 2020, 123 acute cases of hepatitis B³ were reported for a rate of 0.34 cases per 100,000 people.

Reported acute hepatitis B rates, 2011 to 2020⁴

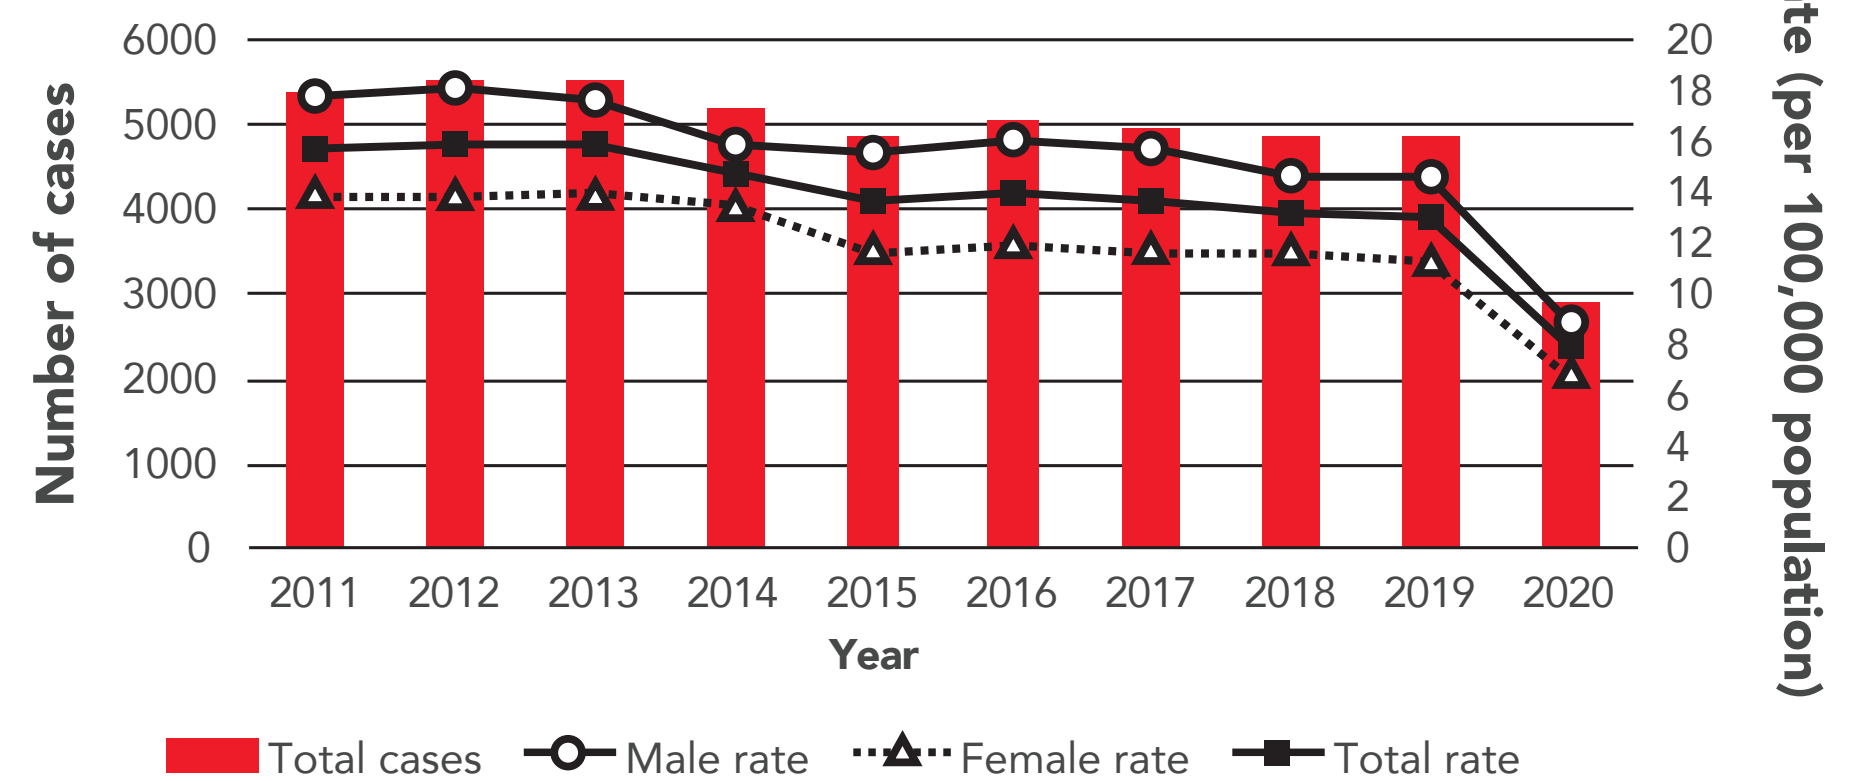

Chronic and unspecified hepatitis B

(infections lasting longer than six months)

National reported chronic and unspecified infection rates were stable from 2015 to 2019. In 2020, 2,881 cases of chronic and unspecified hepatitis B were reported for a rate of 7.9 cases per 100,000 people⁵.

Reported chronic and unspecified hepatitis B rates, 2011 to 2020

Reported acute hepatitis B by sex and age, 2020

63% of reported acute hepatitis B cases were **male**.

Among **males**, those aged **40 to 59 years** old had the **highest reported acute hepatitis B rate**.

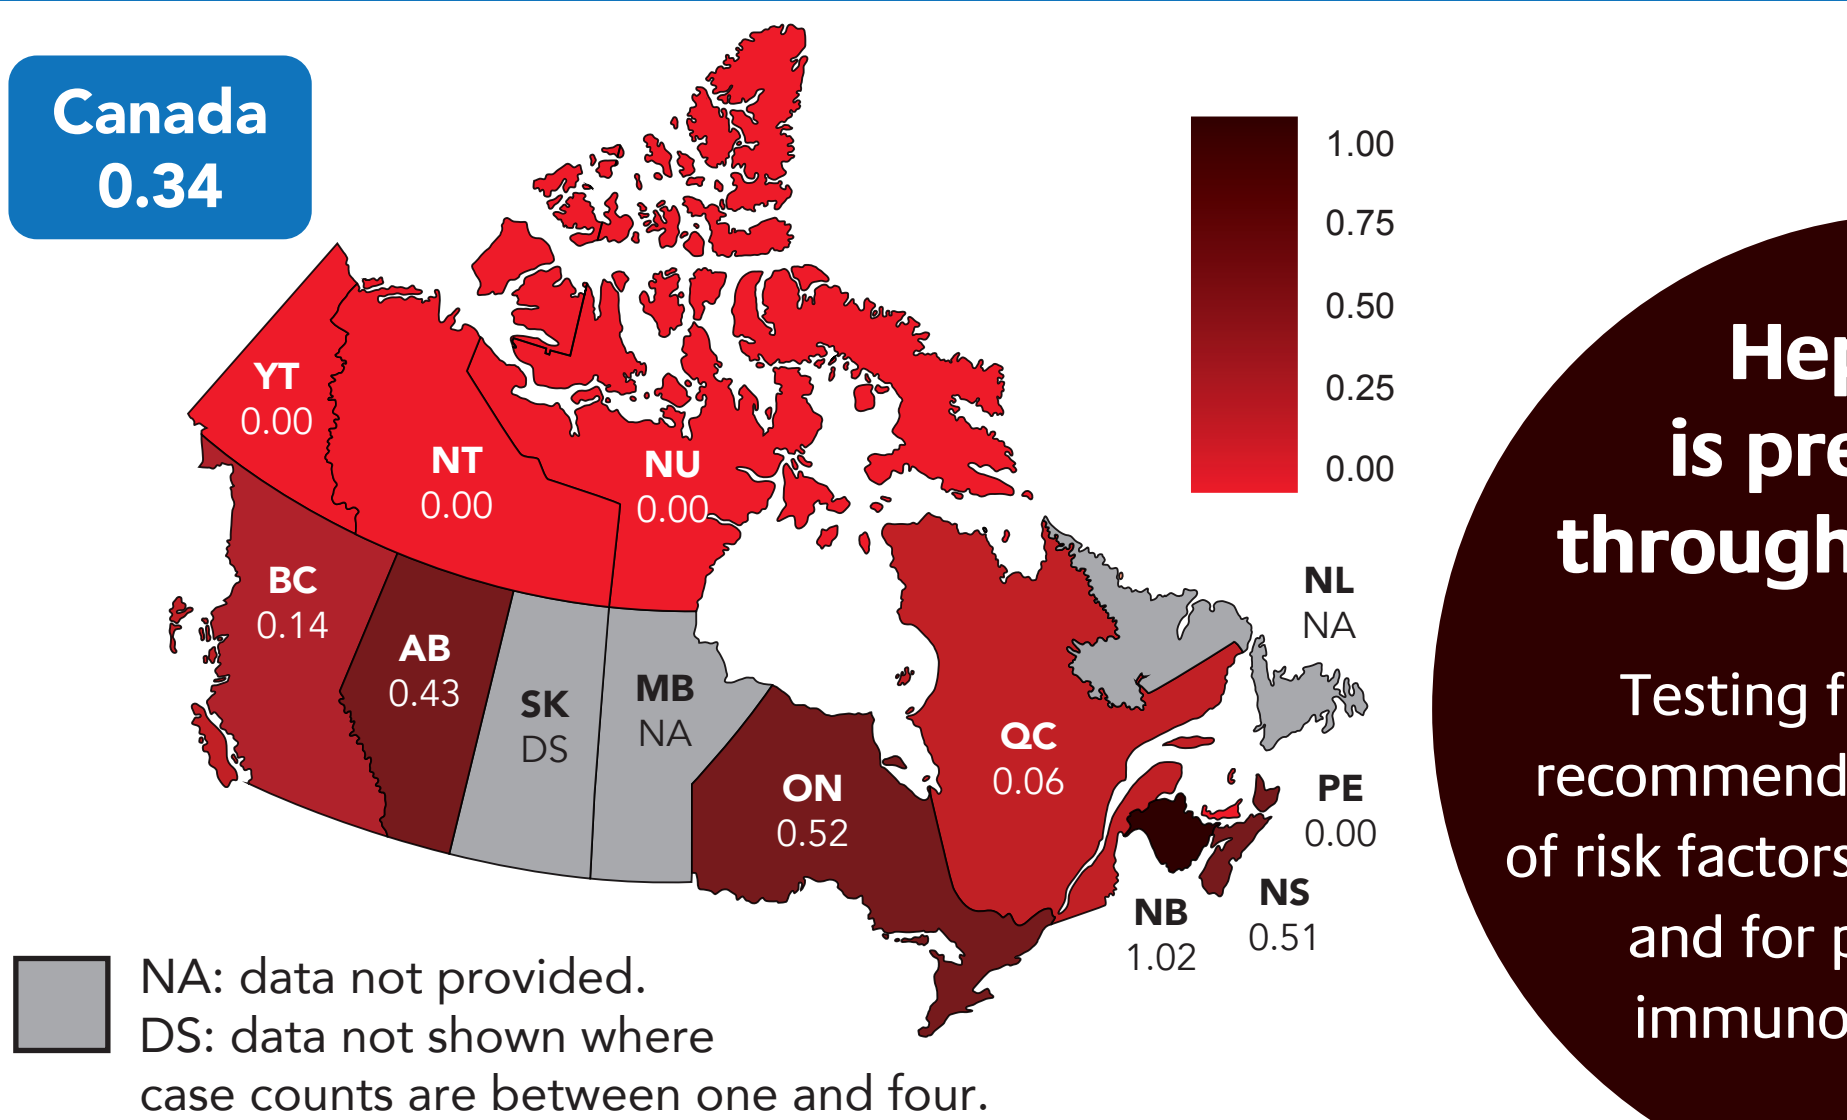

Among **females**, those aged **20 to 24 years** old had the **highest reported acute hepatitis B rate** in 2020.

Reported chronic and unspecified hepatitis B by sex and age, 2020

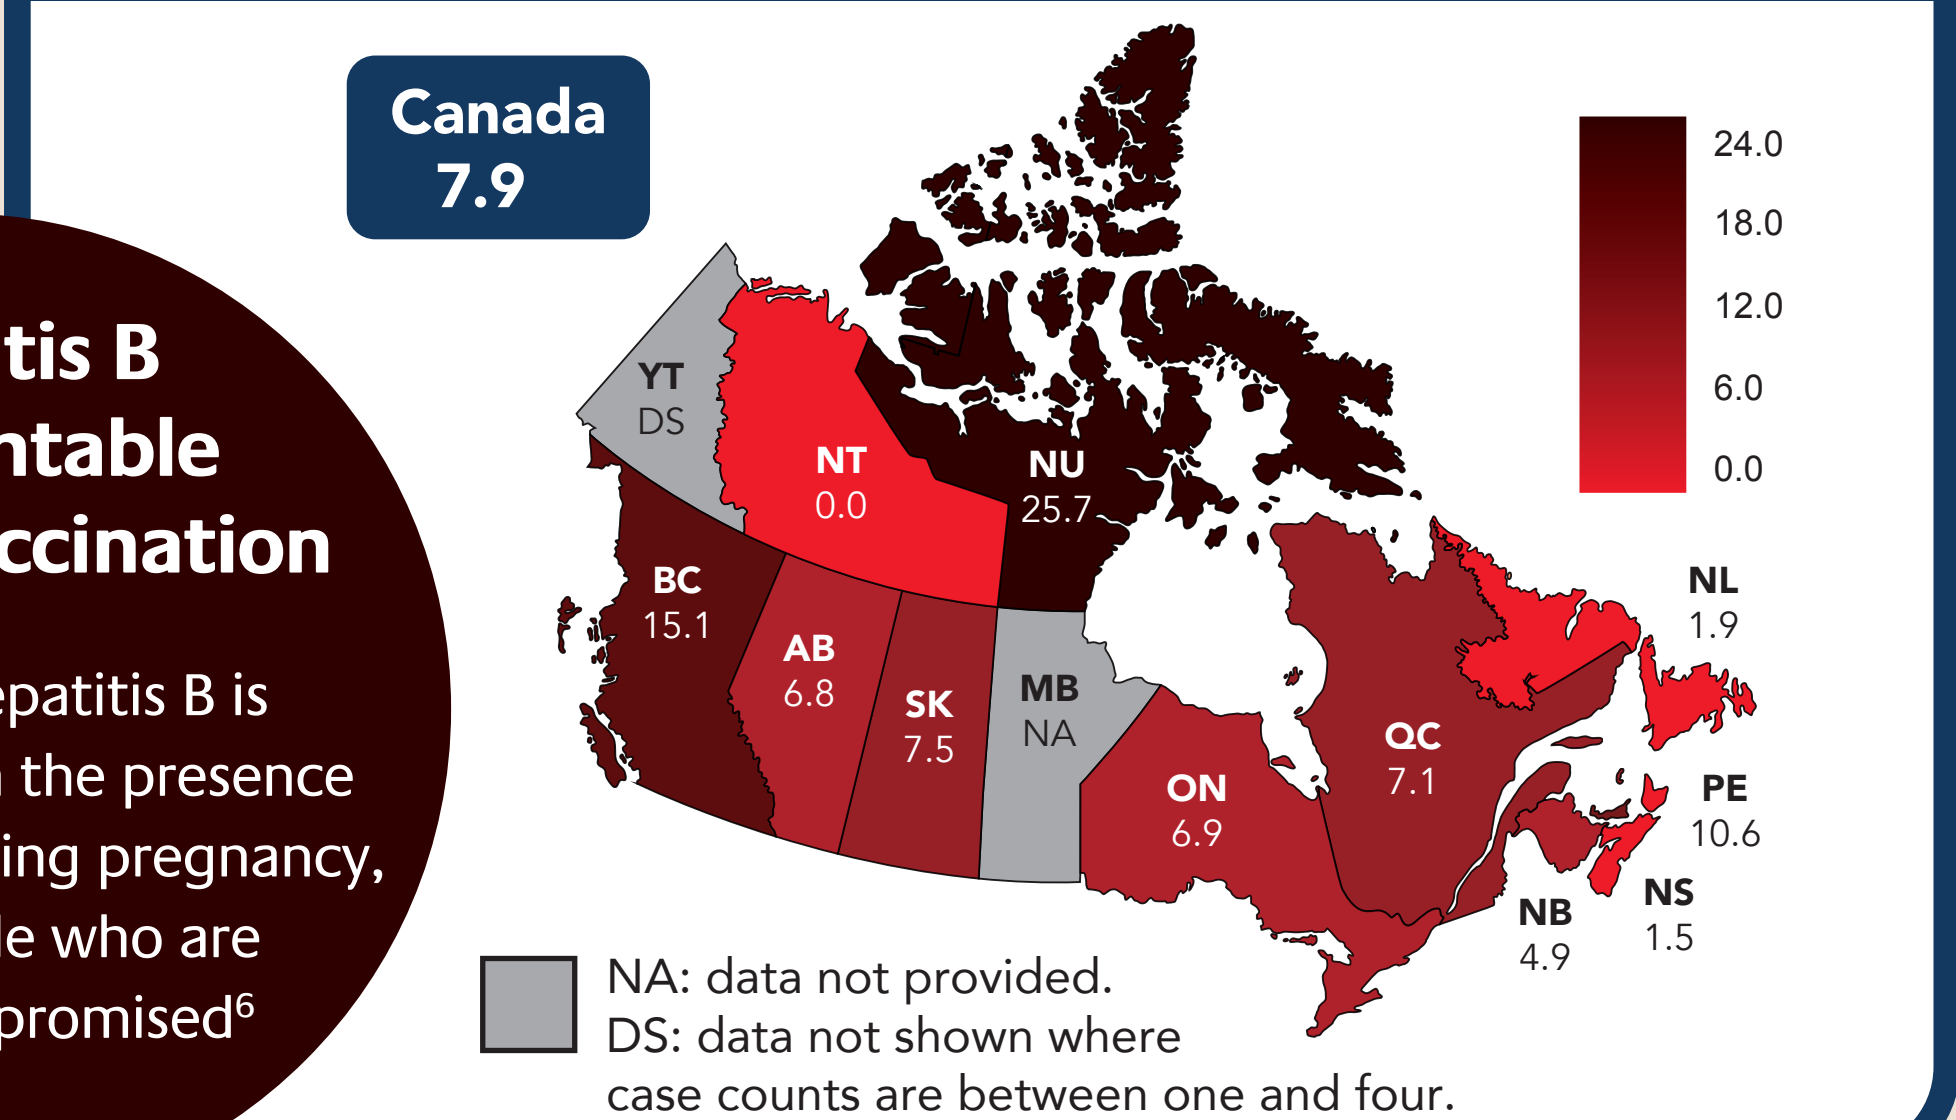

56% of reported chronic and unspecified hepatitis B cases were **male**.

Among **males and females**, reported chronic and unspecified hepatitis B rates were **highest among 30 to 39-year-olds**.

Rates per 100,000 population of reported cases of acute hepatitis B by province and territory in Canada, 2020

Rates per 100,000 population of reported cases of chronic and unspecified hepatitis B by province and territory in Canada, 2020

Hepatitis B is preventable through vaccination

Testing for hepatitis B is recommended in the presence of risk factors, during pregnancy, and for people who are immunocompromised⁶

1. Data source: Canadian Notifiable Disease Surveillance System (<https://diseases.canada.ca/notifiable/>). 2. Population denominator data is from Statistics Canada April 2022 yearly population estimates. 3. All provinces and territories except for Manitoba and Newfoundland and Labrador provided acute hepatitis B 2020 data. 4. Acute hepatitis B reporting by provinces and territories vary from 2011 to 2020. For reporting patterns please see <https://www.canada.ca/en/public-health/services/surveillance/sexually-transmitted-blood-borne-infections.html>. 5. All provinces and territories except for Manitoba provided chronic and unspecified hepatitis B 2020 data. 6.
