Ground-level ozone ($O_3$) is a gas that forms close to the Earth’s surface through reactions between certain pollutants (known as precursors) in the presence of sunlight.

Ozone is a component of smog.

**WHO IS MOST AT RISK TO AIR POLLUTION?**

Even healthy young adults can experience health issues on days when the air is heavily polluted but some groups are more at risk:

- Children
- Seniors
- People with asthma, chronic obstructive pulmonary disease (COPD), cardiovascular diseases, diabetes
- Active people of all ages who exercise or work hard outdoors

**HOW CAN I PROTECT MYSELF FROM AIR POLLUTION?**

Know when the air is unhealthy:

- Check the Air Quality Health Index in your community to find out the best time to be active outside (airhealth.ca)
- If you have a heart or lung condition, talk to your health care professional about additional ways to protect your health when air pollution levels are high

Ways to reduce exposure:

- Avoid or reduce strenuous outdoor activities when air pollution levels are high
- Avoid or reduce exercising during smog episodes

**WHAT ACTION IS THE GOVERNMENT OF CANADA TAKING ON OZONE?**

- Federal regulations have reduced emissions of ozone precursors from key sources in Canada.
- Canada has agreed to international treaties to reduce transboundary flow of ozone and its precursors.
- Canada has established the Canadian Ambient Air Quality Standards (CAAQS). These are health- and environment-based numerical values of outdoor air concentrations of pollutants intended to drive continuous air quality improvement in Canada. The CAAQS, a key element of the Air Quality Management System, were developed through a process steered by the Canadian Council of Ministers of the Environment (CCME).

**LEVELS OF OZONE IN OUTDOOR AIR**

There are variations in levels of ozone in outdoor air by season and region. In general, higher levels of ambient ozone occur in spring and summer, and lower levels in winter. During summer, ozone levels peak between noon and 6 pm.
