CANADIAN ENVIRONMENTAL SUSTAINABILITY INDICATORS

CANADA'S CONSERVED AREAS

July 2020

Table of contents

List of Figures

List of Tables

Canada's conserved areas

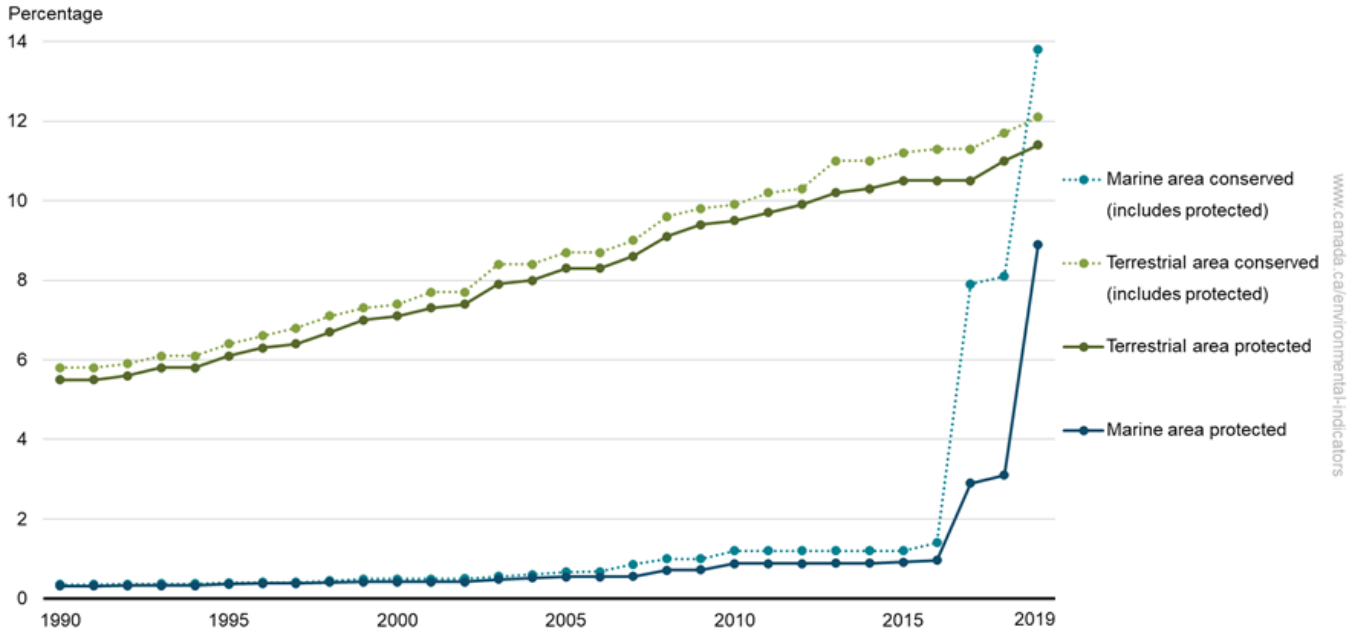
Well-managed conserved areas help preserve species and their habitats for present and future generations by reducing direct human development stresses. Conserved areas play a vital role in conserving Canada's nature. They also provide opportunities for people to connect with nature. The indicators track the amount and proportion of area conserved in Canada.

National conserved areas

Key results

- At the end of 2019, Canada had
  - 12.1% of its terrestrial area (land and freshwater) conserved, including 11.4% in protected areas
  - 13.8% of its marine territory conserved, including 8.9% in protected areas

Figure 1. Proportion of area conserved, Canada, 1990 to 2019



Data for Figure 1

Note: Terrestrial area includes land and freshwater. Area conserved includes area protected as well as areas conserved with other measures. For more information on the definition of protected areas and areas conserved with other measures, please refer to the Data sources and methods. Trends are based on date of conservation, rather than date of reporting. Canada's terrestrial territory is 9 984 670 square kilometres (km^2) and its marine territory is approximately 5 750 000 km^2. Overlaps among protected areas and among areas conserved with other measures were corrected for. Data are current as of December 31, 2019.
Source: Environment and Climate Change Canada (2019) Canadian Protected and Conserved Areas Database.

Conserved areas include protected areas, as well as areas conserved with other measures[1] (that is, areas that do not meet the formal definition of protected area but are managed in a way that conserves biodiversity over the long-term). Conserved areas are lands and waters where use is limited. In some cases, certain commercial activities and harvesting of biological resources may be allowed so long as they do not go against conservation objectives of the area.

[1] In the indicators, the term "areas conserved with other measures" is equivalent to "other effective area-based conservation measures."

Terrestrial area conserved has increased by 65% in the last 20 years and by 8% in the last 5 years. Marine area conserved has increased by more than 3 800% in the last 20 years and by more than 1 000% in the last 5 years. In 2019, Canada surpassed its 2020 marine conservation target of 10%, by conserving 13.8% of its marine territory.[2]

The distribution and size of conserved areas is variable. Larger terrestrial conserved areas tend to be located in northern Canada, where there is less intensive use of land for agriculture, settlements, and road networks. Larger marine conserved areas tend to be located in offshore areas or in northern Canada, where human uses are often less intensive. In landscapes and seascapes with competing uses, conserved areas tend to be smaller but more numerous.

Navigate data using the interactive map

[2] In 2015, Canada established its 2020 Biodiversity Goals and Targets for Canada. Target 1 states: "By 2020, at least 17 percent of terrestrial areas and inland water, and 10 percent of coastal and marine areas, are conserved through networks of protected areas and other effective area-based conservation measures." At the time, 10.5% of Canada's terrestrial area and around 1% of its marine area were recognized as protected.

Note: Terrestrial area includes land and freshwater. Data are current as of December 31, 2019.

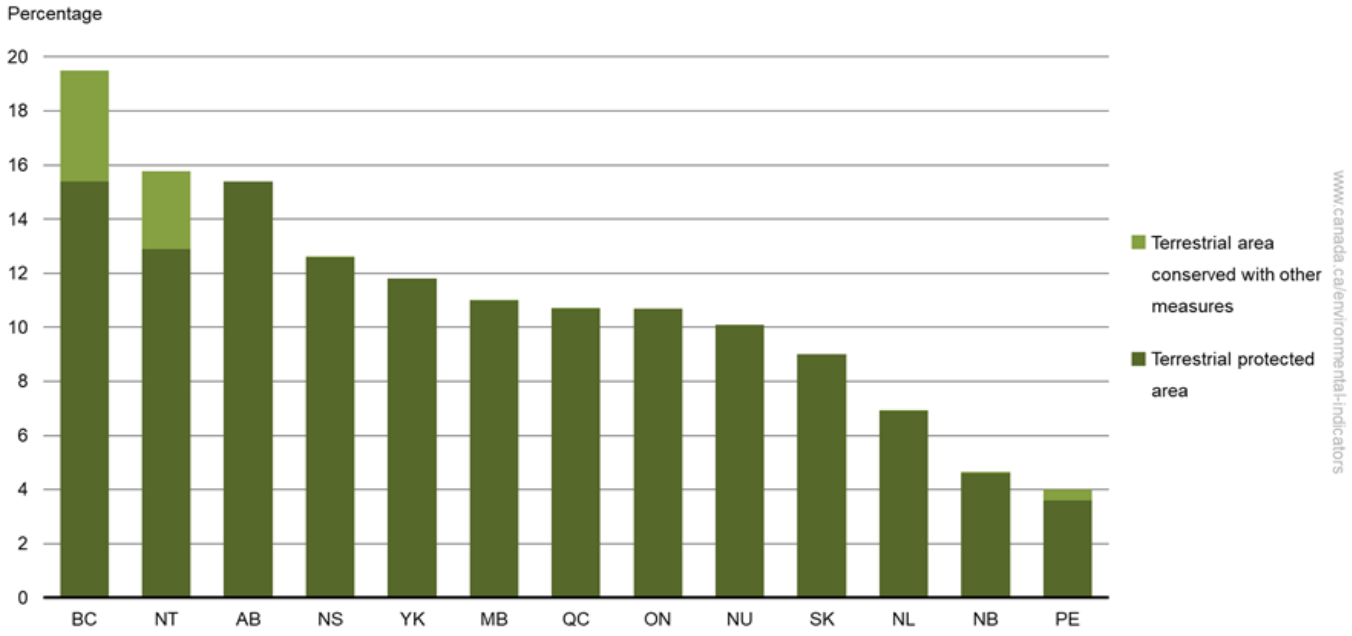
Terrestrial conserved areas, within each province and territory

Key results

- The proportion of terrestrial area (land and freshwater) conserved varies by province and territory. It ranges from 4.0% in Prince Edward Island to 19.5% in British Columbia
- Additions in 2019 include:
    - Thaidene Nëné National Park Reserve, Thaidene Nëné Wildlife Conservation Area and Thaidene Nëné Territorial Protected Area, which added 26 000 square kilometres (km^2) of protected area in the Northwest Territories
    - Kitaskino Nuwenëné Wildland Provincial Park, which added 1 600 km^2 of protected area in Alberta
    - Tanzin Lake Ecological Reserve, which added 1 110 km^2 of protected area in Saskatchewan
    - 38 000 km^2 of area conserved with other measures was recognized in British Columbia
    - Canadian Forces Base Shilo, which added 231 km^2 of area conserved with other measures in Manitoba

Figure 3. Proportion of terrestrial area conserved, by province and territory, Canada, 2019



Data for Figure 3

Note: Terrestrial area includes land and freshwater. Data are current as of December 31, 2019.
Source: Environment and Climate Change Canada (2019) Canadian Protected and Conserved Areas Database.

At the end of 2019, 12.1% of Canada's terrestrial area was conserved. British Columbia had 19.5% of its terrestrial area conserved. The Northwest Territories had 15.8% of its territory conserved, while Alberta had 15.4% conserved. Newfoundland and Labrador, New Brunswick and Prince Edward Island, each had less than 7% of their terrestrial territory conserved. The remaining provinces and territories had between 9% and 13% of their terrestrial territory conserved.

Each province has set aside areas for conservation, and progress towards conservation targets varies by jurisdiction. An increasing number of Indigenous protected areas and areas conserved with other measures are being established. Recent examples include:

- Central Purcell Mountains Indigenous Protected and Conserved Area in British Columbia
- Tłı̨chǫ Lands Indigenous Conserved Area and Edéhzhíe Indigenous Protected Area in the Northwest Territories
- Kitaskino Nuwenëné Wildland Provincial Park in Alberta

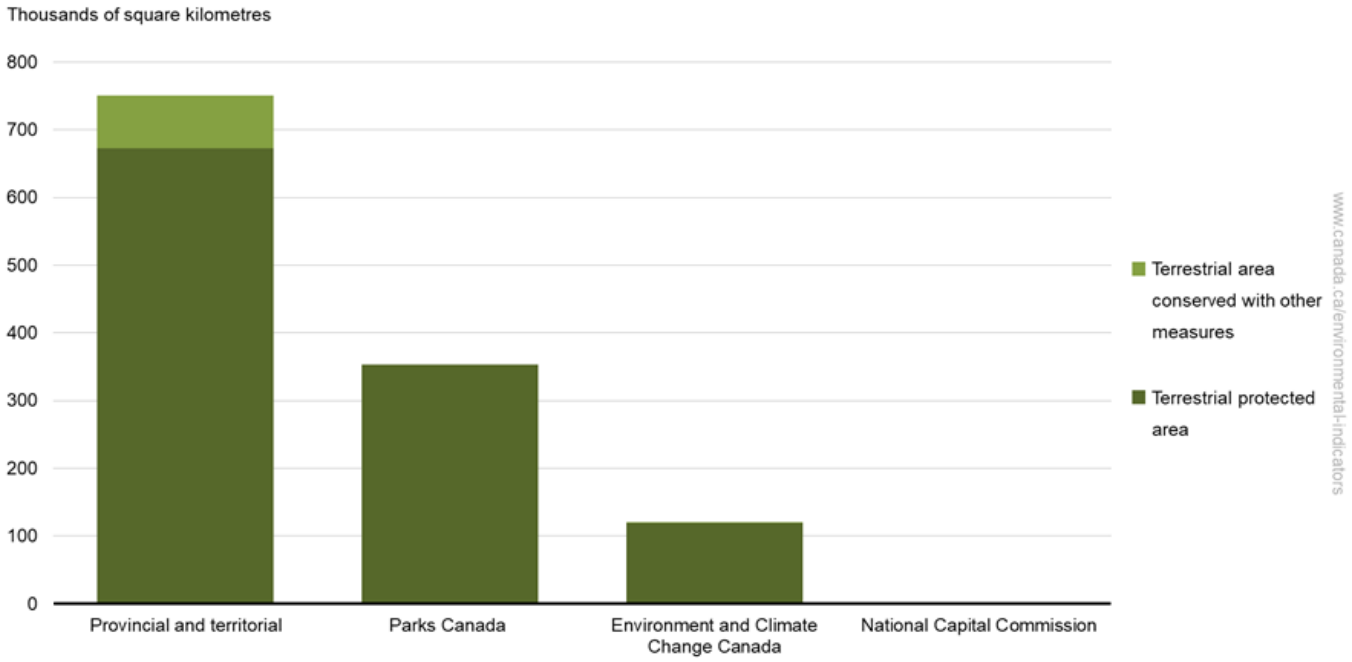
These areas are managed cooperatively with jurisdictions and Indigenous people, or by Indigenous people.

Terrestrial conserved areas, by reporting jurisdiction

Key results

- Over 61% of all terrestrial area conserved are reported by provincial and territorial jurisdictions
- Parks Canada and Environment and Climate Change Canada are responsible for 29% and 10% of Canada's terrestrial conserved areas, respectively

Figure 4. Terrestrial area conserved, by reporting jurisdiction, Canada, 2019



Data for Figure 4

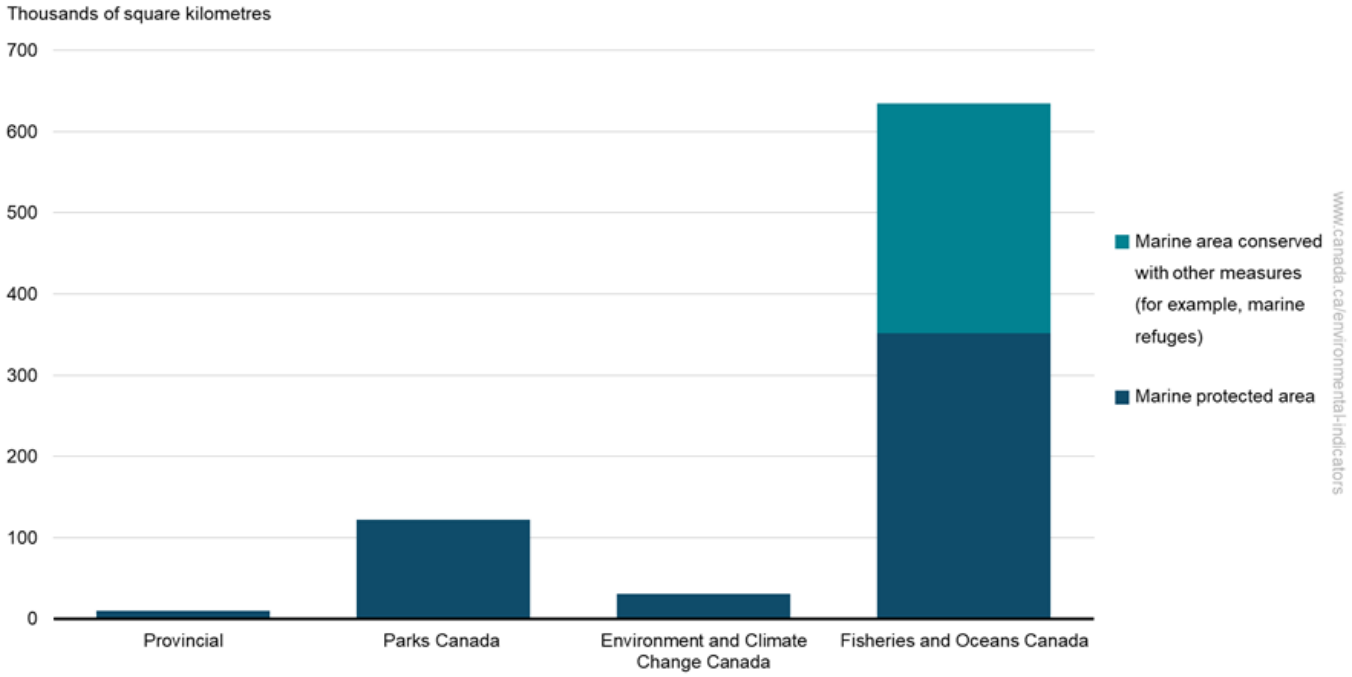
Note: Terrestrial area includes land and freshwater. Data are current as of December 31, 2019.
Source: Environment and Climate Change Canada (2019) Canadian Protected and Conserved Areas Database.

Marine conserved areas, by reporting jurisdiction

Key results

- In 2019,
  - Canada surpassed its target to conserve 10% of its marine territory
  - the Tuvaijuittuq Marine Protected Area added 319 411 square kilometres (km^2) of protected area
- At the end of 2019, marine refuges covered about 283 000 km^2 of Canada's marine territory
- Fisheries and Oceans Canada and Parks Canada are responsible for 80% and 15% of Canada's marine conserved areas, respectively

Figure 5. Marine area conserved, by reporting jurisdiction, Canada, 2019



Data for Figure 5

Note: Data are current as of December 31, 2019.
Source: Environment and Climate Change Canada (2019) Canadian Protected and Conserved Areas Database.

Marine refuges are long-term fisheries area closures that have been assessed as meeting Canada's criteria for marine areas conserved with other measures.

Fisheries and Oceans Canada, Parks Canada and Environment and Climate Change Canada each have specific but complementary mandates for establishing marine protected areas:

- *Oceans Act* marine protected areas (Fisheries and Oceans Canada) are established to conserve marine species and their habitats, including species that are fished, endangered or threatened marine species, as well as unique habitats and areas of high biological productivity or biodiversity
- National marine conservation areas (Parks Canada) are established to conserve representative examples of Canada's natural and cultural marine heritage and to provide opportunities for public education and enjoyment
- National wildlife areas and migratory bird sanctuaries (Environment and Climate Change Canada) are established to conserve habitat for a variety of wildlife including migratory birds and endangered species

Areas established by these departments, along with provincially established areas, contribute to the conservation network. The primary goal of this network is to provide long-term conservation of marine biodiversity, ecosystem function and special natural features.

The different jurisdictions conserve areas for different purposes,[3] and control the amount of human activity (such as transportation, fishing or recreation) that is allowed. Marine conservation efforts include a wide range of management and stewardship activities. Examples include support for the recovery of species at risk, prevention and mitigation of the impact of aquatic invasive species, and strengthening of Canada's response to ship-source marine pollution.

[3] The Role of the Canadian Government in the Oceans Sector and The Role of the Provincial and Territorial Governments in the Oceans Sector.

Conserved areas, by ecological area

Canada's territory can be divided into 31 terrestrial and marine ecozones. Terrestrial ecozones are further divided into 215 terrestrial ecoregions. A representative conserved areas network should conserve biodiversity across all of Canada's ecological areas.

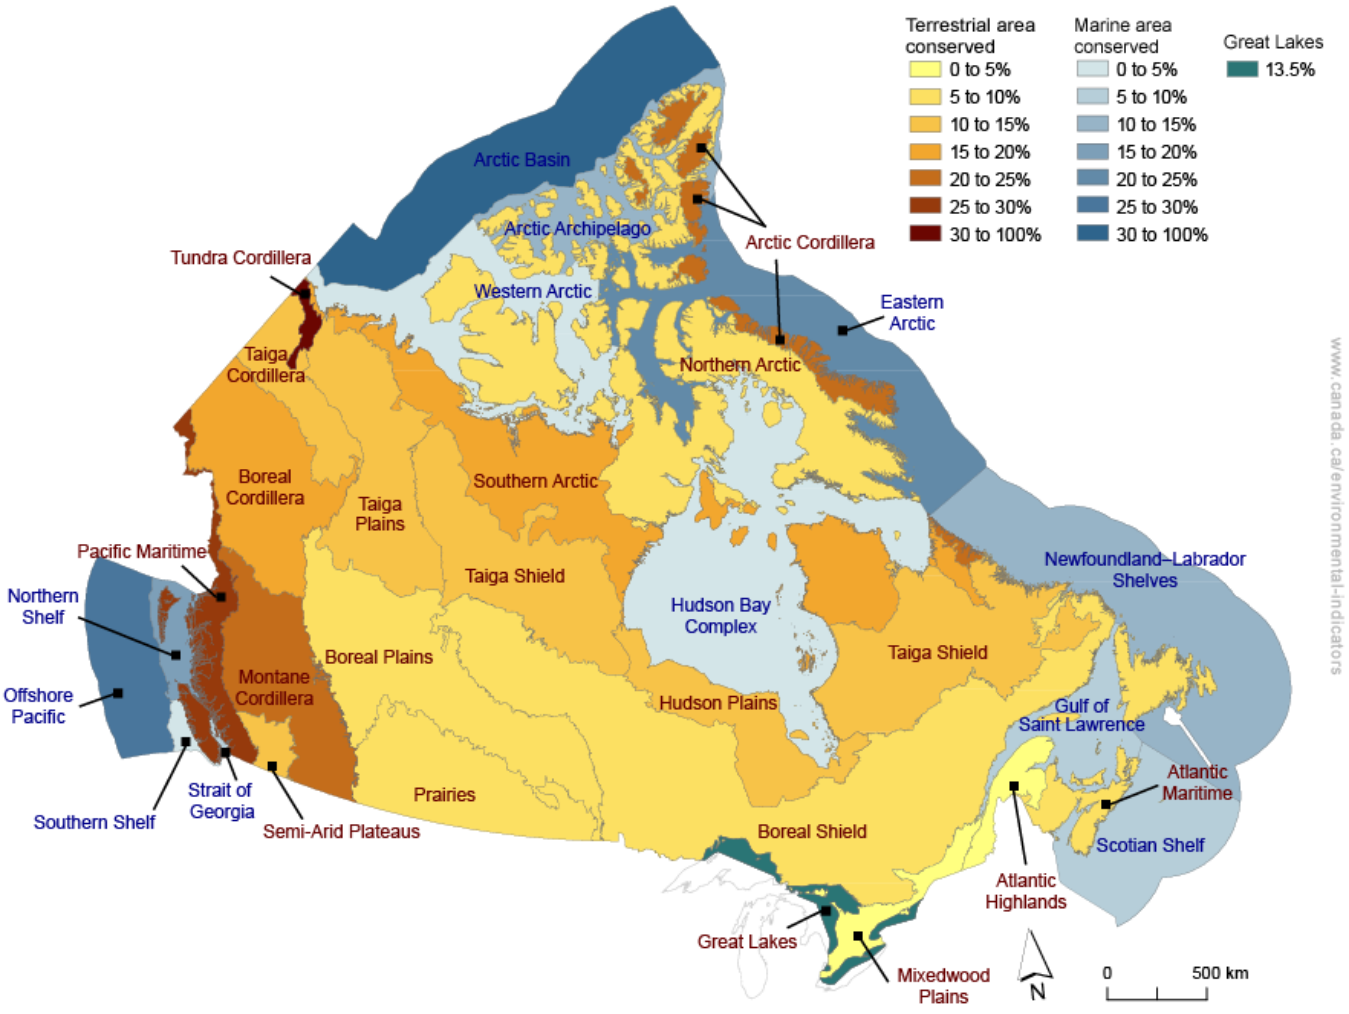
Conserved areas, by ecozone

Ecozones represent areas of the earth's surface where the physical and living parts function as a larger system.

Key results

- Four (4) terrestrial ecozones, the Tundra Cordillera, the Pacific Maritime, the Montane Cordillera and the Arctic Cordillera, have more than 20% of their area conserved
- Three (3) marine ecozones, the Arctic Basin, the Offshore Pacific and the Eastern Arctic, have more than 20% of their area conserved
- 13.5% of the Canadian area of the Great Lakes is conserved

Figure 6. Proportion of area conserved, by ecozone, Canada, 2019



Data for Figure 6

Note: Area conserved includes area protected as well as area conserved with other measures. Data are current as of December 31, 2019.
Source: Environment and Climate Change Canada (2019) Canadian Protected and Conserved Areas Database.

Terrestrial ecozones with high levels of urbanization and development or widespread agriculture tend to have small proportions of conserved area. For example, the Mixedwood Plains (in southern Ontario and along the St. Lawrence River) has only 2.0% of its area conserved and the Prairies has 6.1%. On the other hand, terrestrial ecozones with a high proportion of conserved area tend to be remote or have high recreation value. For example, ecozones in the western mountain ranges have 19% or more of their area conserved.

Recent efforts have rapidly increased the amount of area conserved in some marine ecozones. Tuvaijuittuq Marine Protected Area in the Arctic Basin is the largest marine protected area in Canada, increasing the proportion of the ecozone protected from less than 1% to 37.8%. Marine refuges in the Offshore Pacific, Eastern Arctic, Newfoundland-Labrador Shelves, Scotian Shelf and Gulf of St. Lawrence have conserved more than 5% of each of these areas.

Each ecozone is unique, and conservation involves the inclusion of areas that are representative of different parts of the ecozone and sites of special value. Challenges to establishing conserved areas include competition from other uses, such as agriculture, industry or urban development, and it may be limited by the extent of ecologically intact areas within the ecozone.

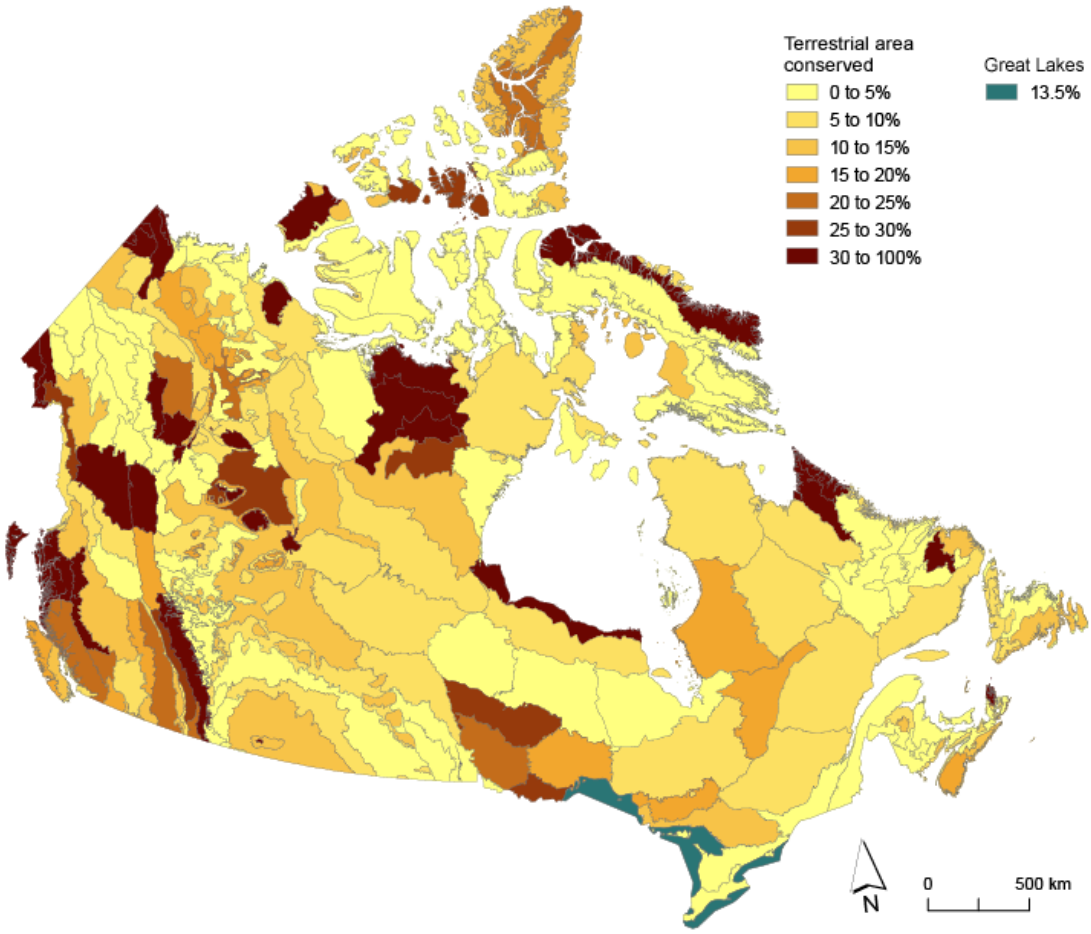
Conserved areas, by ecoregion

Ecoregions are subdivisions of ecozones characterized by distinctive regional attributes. These include climate, physiology, vegetation, soil, water and fauna.

Key results

- Of the 215 ecoregions in Canada,
    - 75% (161 ecoregions) have less than 17% of their area conserved
    - 10% (21 ecoregions) have between 17% and 30% of their area conserved
    - 15% (33 ecoregions) have more than 30% of their area conserved

Figure 7. Proportion of area conserved, by ecoregion, Canada, 2019



Data for Figure 7

Note: Area conserved includes area protected as well as area conserved with other measures. Data are current as of December 31, 2019.
Source: Environment and Climate Change Canada (2019) Canadian Protected and Conserved Areas Database.

The area conserved varies greatly among ecoregions. Ecoregions that have the highest proportion of area conserved are associated with large protected areas. For example, the Peace-Athabasca Delta ecoregion has 94.4% of its area conserved (Wood Buffalo National Park) and the Mount Logan ecoregion has 100% of its area conserved (Kluane National Park and Reserve). On the other hand, ecoregions in urban or agricultural landscapes have the lowest proportion of area conserved. The James Bay Lowlands, Lake Simcoe and Lake Erie - Lake Ontario ecoregions all have less than 3% of their area conserved.

About the indicators

What the indicators measure

These indicators report the amount and proportion of Canada's terrestrial (land and freshwater) and marine area that is conserved. Canada recognizes the international definitions of protected areas and other effective area-based conservation measures (One with Nature 2018 [PDF; 2.12 MB]). Land and/or water access and use within protected areas are controlled primarily for the purpose of conserving nature (for example, a park, a conservation area or a wildlife reserve). Other effective area-based conservation measures are also managed over the long term in ways that result in the effective conservation of biodiversity. However, they might have been established for other purposes.

Why these indicators are important

Well-managed conserved areas are one way to protect wild species and their habitats for present and future generations. Habitat conservation is a measure of human response to the loss of biodiversity and natural habitat. As the area conserved in Canada increases, more lands and waters are withdrawn from direct human development stresses, thereby contributing to biodiversity conservation and improving the health of ecosystems. In turn, healthy ecosystems provide benefits such as clean water, mitigation of climate change, pollination and improved human health.

Many countries use protected areas as the core of their programs to preserve biodiversity, ecosystems and ecosystem services. The parties to the Convention on Biological Diversity, among them Canada, have set an aspirational target to conserve at least 17% of terrestrial areas and inland waters, and 10% of marine areas, by 2020. This is the 11th of 20 targets collectively known as the Aichi Biodiversity Targets, established in October 2010.

As part of its work towards achieving Target 1 of the 2020 Biodiversity Goals and Targets for Canada, Canada has conserved new areas and recognized previously existing areas. The Pathway to Canada Target 1 initiative focusses on terrestrial and freshwater areas, while Fisheries and Oceans Canada leads on meeting marine conservation targets. In 2015, when the Biodiversity Goals and Targets were established for Canada, 10.5% of Canada’s terrestrial area and around 1% of its marine area were recognized as protected.

Healthy coasts and oceans

These indicators track progress on the 2019 to 2022 Federal Sustainable Development Strategy, supporting the target: By 2020, 10% of coastal and marine areas are conserved through networks of marine protected areas and other effective area-based conservation measures. The most recent data available shows that, as of the end of 2019, 13.8% of Canada's coastal and marine areas were conserved through a network of marine protected areas and other effective area-based conservation measures, including 8.9% in protected areas.

Sustainably managed lands and forests

These indicators track progress on the 2019 to 2022 Federal Sustainable Development Strategy, supporting the target: By 2020, at least 17% of terrestrial areas and inland water are conserved through networks of protected areas and other effective area-based conservation measures. The most recent data available shows that, as of the end of 2019, 12.1% of Canada's terrestrial areas and inland water were conserved through a network of protected areas and other effective area-based conservation measures, including 11.4% in protected areas.

In addition, the indicators contribute to the Sustainable Development Goals of the 2030 Agenda for Sustainable Development. They are linked to Goal 14, Life Below Water and Target 14.5, "By 2020, conserve at least 10% of coastal and marine areas, consistent with national and international law and based on the best available scientific information." They are also linked to Goal 15, Life on Land and Target 15.1, "By 2020, ensure the conservation, restoration and sustainable use of terrestrial and inland freshwater ecosystems and their services, in particular forests, wetlands, mountains and drylands, in line with obligations under international agreements."

The indicators also contribute towards reporting on Target 1 of the 2020 Biodiversity Goals and Targets for Canada: "By 2020, at least 17 percent of terrestrial areas and inland water, and 10 percent of coastal and marine areas, are conserved through networks of protected areas and other effective area-based conservation measures."

Related indicators

The Ecological integrity of national parks indicator reports on the condition of ecosystems within national parks, an important element of Canada's conserved area network.

The Global trends in protected areas indicator compares Canada's protected area to a peer group of countries.

Data sources and methods

Data sources

Data are taken from the Canadian Protected and Conserved Areas Database (the database). Data from federal, provincial and territorial jurisdictions, the authoritative data sources, are compiled by Environment and Climate Change Canada.

More information

Protected areas and areas conserved with other measures

Protected areas together with areas conserved with other measures are referred to as conserved areas. Protected areas are areas recognized as meeting the international definition for a protected area. Areas conserved with other measures must meet all elements of the Pan-Canadian definition and international definition to be recognized as conserved. [4,5] The Convention on Biodiversity defines an "other effective area-based conservation measure" as "a geographically defined area other than a Protected Area, which is governed and managed in ways that achieve positive and sustained long-term outcomes for the in situ conservation of biodiversity."

Data description

The database contains data consolidated from all jurisdictions with responsibilities for conserved areas in Canada. Data are current as of December 31, 2019.

At least once each year, federal, provincial and territorial departments and agencies submit geospatial and ancillary data for conserved areas under their administrative control. Data on areas controlled by Indigenous or non-governmental organizations, such as the Nature Conservancy of Canada and Ducks Unlimited Canada, are included in cases where a jurisdiction has recognized those areas.

The data include the name of the area, its geospatial location, boundaries, official area, biome (terrestrial/marine), International Union for Conservation of Nature management category, managing jurisdiction, and protection date, among other information.

In cases where the same attribute information does not apply to the entire conserved area, the area is divided into zones for reporting. For example, a single protected area that crosses a provincial border is divided into zones corresponding to the different provinces. Similarly, a protected area that is later expanded is treated as several zones, each with its own protection date. Terrestrial and marine sections are treated as separate zones; freshwater is included in the terrestrial zone. Ancillary data are maintained independently for each zone. Conserved areas that are undivided are treated as a single zone.

Work is ongoing to capture and incorporate data on additional privately held protected areas and on areas being conserved through means other than formal protection.

Jurisdictional area

- For Canada and for all provinces and territories except Quebec: Natural Resources Canada (2005) Canada Centre for Remote Sensing, Land and freshwater area, by province and territory
- For Quebec: Ministère du Développement durable, de l'Environnement et de la Lutte contre les changements climatiques
- Canada's marine territory: Fisheries and Oceans Canada (2013) departmental analysis based on National Resources Canada (2009) Atlas of Canada 1:1,000,000 National Frameworks Data, Administrative Boundaries

National boundaries

Natural Resources Canada (2019) CanVec Series 1:1,000,000 Geopolitical Region, Administrative Boundaries.

Ecozones and ecoregions

Environment and Climate Change Canada (2019) Canadian Terrestrial Ecological Framework. Marine ecozones are based on Fisheries and Oceans Canada (2016) Federal Marine Bioregions (Canadian Science Advisory Secretariat, Science Advisory Report 2009/056).

Methods

The area conserved is estimated by means of a geographical analysis based on reported boundaries, accounting for overlaps. Separate estimates are made for protected areas and for areas conserved with other measures.

More information

Calculating Canada's conserved area

The Canadian Protected and Conserved Areas Database (the database) contains information on the protection (or conservation) date for each zone. For some zones, it also contains a delisting date.

To estimate the terrestrial protected area trend over time:

1. All polygons representing terrestrial protected areas that were protected in 1990 or earlier were selected from the database
2. The selected polygons were dissolved into a single polygon (removing overlaps), and the resulting area calculated using Albers Equal Area Conic projection
3. The process was repeated for each subsequent year (delisted areas were removed from the analysis starting in the year they were delisted)
4. Estimates were divided by the total terrestrial area of Canada to determine the proportion protected

To estimate the marine protected area, a similar process was followed, selecting protected marine polygons at each step. The process was repeated for areas conserved with other measures, for both terrestrial and marine. Total area conserved was calculated by summing area protected and area conserved with other measures.

Polygons with an unknown conservation date comprise 3.2% of the total conserved area. If a polygon with an unknown conservation date was described as "interim," it was assigned a conservation date based on the year it was first reported to the database (1.5% of total conserved area); otherwise it was treated as having been conserved prior to 1990.

Terrestrial conserved areas, within each province and territory

The database contains information on the province or territory in which a conserved area is located. Using methodology similar to that used for reporting trends in the national indicator, for each province and territory, terrestrial protected area polygons were combined into a single polygon and the area calculated. The analysis was repeated for terrestrial areas conserved with other measures.

Terrestrial and marine conserved areas, by reporting jurisdiction

The database also contains information on the jurisdiction responsible for each conserved area. As with the national indicator, for each jurisdiction, protected areas polygons were combined into a single polygon

and the total area was calculated. Additional analysis was conducted to estimate the area for areas conserved with other measures.

Conserved areas, by ecological area

The database does not contain information on ecological areas. To generate an estimate of conserved area within each ecozone and ecoregion, a geospatial analysis was conducted. However, national ecozone and ecoregion boundaries are more generalized than local conserved areas boundaries, and this has the potential to affect estimates in coastal areas. To avoid this problem, marine conserved area polygons that mapped outside a marine ecozone were assigned to the nearest marine ecozone. Similarly, terrestrial conserved areas that mapped outside a terrestrial ecozone were assigned to the nearest terrestrial ecozone. The steps followed were:

1. A working layer containing generalized ecozone boundaries was developed
    i. Marine ecozone boundaries were copied from the national ecozone coverage, and marine ecozone polygons were extended inland to include adjacent terrestrial regions
2. The marine protected area polygons were selected from the database
3. The working layer and the marine protected area polygons were combined into a single layer
    i. Marine protected areas that crossed ecozone boundaries were divided at the boundary
4. Protected area polygons were selected from the combined layer, and the overlap-corrected area was calculated for each generalized ecozone, resulting in marine areas being assigned to the correct ecozone
5. The process was repeated for marine areas conserved with other measures
6. The process was repeated for terrestrial protected areas and terrestrial areas conserved with other measures

To be consistent with the projection used in the database, the ecozone layer was re-projected to Albers Equal Area Conic. The total area of each ecozone was then calculated from its geospatial boundaries. The Newfoundland-Labrador Shelves ecozone area was corrected for the territorial area of St Pierre and Miquelon. The total area conserved per ecozone was divided by the total area of the ecozone in order to generate a percentage.

For the terrestrial ecoregion analysis, a geospatial analysis calculated the overlap-adjusted protected area and area conserved with other measures within each ecoregion. Terrestrial conserved areas falling outside the ecoregion boundaries were assigned to the nearest ecoregion.

Recent changes

Data are regularly reviewed and updated. The completeness of the database is continuously being improved as existing conservation areas are reviewed and added to the database if appropriate.

In 2018, the Conservation Areas Reporting and Tracking System was converted to the Canadian Protected and Conserved Areas Database and brought formally within Environment and Climate Change Canada.

Caveats and limitations

Comparisons with previous reports should be made with caution, as data quality and completeness continue to improve. Privately protected land and other effective area-based conservation measures contribute to achievement of Canada's targets, but many are not yet captured within the database.

More information

The area protected or conserved calculated using polygon boundaries may differ from the "official area" reported in the Canadian Protected and Conserved Areas Database.

Responsibility for source data accuracy and completeness lies with the jurisdictions. Jurisdictional work is guided by the federal, provincial and territorial report One with Nature (PDF; 2.12 MB). Guidance material and decision support tools were adapted from, and in collaboration with, the Canadian Council on Ecological Areas. Nonetheless, some differences in the approach jurisdictions take in recognizing protected areas and areas conserved with other measures can be expected.

Areas that are no longer recognized as protected or conserved ("decommissioned" or "delisted") are not captured comprehensively and may be missing from the database. Decommissioned or delisted areas are counted from their establishment date until their delisting date.

Complex boundaries, such as coastlines and ecological areas, must be generalized for mapping purposes. In nature, ecozones or ecoregions do not have sharp boundaries. Due to the uncertainty of such boundaries, results should be seen as estimates rather than precise measurements. The mismatch in scale between conserved areas, mapped with fine detail, and national-scale geographic frameworks, mapped at a broad scale, may lead to minor differences across the various summaries because of the measurement uncertainty inherent in this type of analysis. Differences in the delineation of coastlines may result in a small amount of overlap between marine and terrestrial conserved area polygon boundaries; these overlaps have not been addressed.

Ecozones and ecoregions are ecologically based frameworks and should not be considered an expression of sovereignty. The 2019 updates to the ecozone and ecoregion frameworks have been completed for the purpose of reporting on national representation for the Pathway to Canada Target 1 initiative, and do not represent an official update of the 1995 National Ecological Framework. While the 2019 framework contains the most up-to-date information from jurisdictions, it should be noted that a different methodology was used by each data provider to determine the boundaries of the ecozones and ecoregions and that this national layer may differ from the provincial and territorial layers.

Protection is a designation, and the indicators do not provide information on the effectiveness of protection, the degree to which the ecological functioning of the area is intact, or the degree to which pressures outside a conserved area might affect the biodiversity within it. For example, an "other effective area-based conservation measure," such as a marine refuge, restricts certain activities without limiting others.

Note: Terrestrial area includes land and freshwater. Area conserved includes area protected as well as areas conserved with other measures. For more information on the definition of protected areas and areas conserved with other measures, please refer to the Data sources and

methods. Trends are based on date of conservation, rather than date of reporting. Canada's terrestrial territory is 9 984 670 km^2 and its marine territory is approximately 5 750 000 km^2. Overlaps among protected areas and among areas conserved with other measures were corrected for. Data are current as of December 31, 2019.
