 42 *Qualité (chimie et fabrication) : Questions et réponses*

43 **FOREWORD**

44

45 Guidance documents are meant to provide assistance to industry and health care professionals on
46 **how** to comply with governing statutes and regulations. Guidance documents also provide
47 assistance to staff on how Health Canada mandates and objectives should be implemented in a
48 manner that is fair, consistent and effective.

49

50 Guidance documents are administrative instruments not having force of law and, as such, allow
51 for flexibility in approach. Alternate approaches to the principles and practices described in this
52 document **may be** acceptable provided they are supported by adequate justification. Alternate
53 approaches should be discussed in advance with the relevant program area to avoid the possible
54 finding that applicable statutory or regulatory requirements have not been met.

55

56 As a corollary to the above, it is equally important to note that Health Canada reserves the right
57 to request information or material, or define conditions not specifically described in this
58 guidance, in order to allow the Department to adequately assess the safety, efficacy or quality of
59 a therapeutic product. Health Canada is committed to ensuring that such requests are justifiable
60 and that decisions are clearly documented.

61

62 This document should be read in conjunction with the accompanying notice and the relevant
63 sections of other applicable guidance documents.

64

65	Table of Contents
66	
67	ADDENDUM – QUALITY (CHEMISTRY AND MANUFACTURING) GUIDANCE –
68	QUESTIONS AND ANSWERS.....
69	3.2.S DRUG SUBSTANCE.....
70	3.2.S.4 Control of Drug Substance.....
71	3.2.S.5 Reference Standards or Materials
72	3.2.P DRUG PRODUCT.....
73	3.2.P.2 Pharmaceutical Development
74	3.2.P.3 Manufacture
75	

76 **ADDENDUM - Quality (Chemistry and Manufacturing) Guidance - Questions and**
77 **Answers**

78 Questions and answers are published from time to time to provide additional clarity and
79 interpretation of guidance. These Questions and Answers as published will be open for comment
80 at the time they are published in the Question and Answer format. During updates to guidance,
81 the interpretation is either incorporated into updated guidance or will be published in this
82 addendum in the Question and Answer format.

83 This order of the questions in this section is listed in CTD format for ease of access.

84 **3.2.S Drug Substance**

85 **3.2.S.4 Control of Drug Substance**

86 **Q): When qualifying a limit for an impurity in a generic product based on levels found in**
87 **the Canadian Reference Product (CRP), what evidence should be submitted to show that it**
88 **is the same impurity that is being analysed?**

89 **A):** Generally, having the same retention time in an HPLC run using a single method, would not
90 be considered sufficient to show the same impurity is being analysed. As such, it is
91 recommended that samples of both the test and reference materials be spiked with the same
92 impurity reference standard to show increased concentrations. For unidentified impurities,
93 confirmation by another technique should be utilised, for example (e.g.), retention time
94 comparison using a different chromatographic method, diode array spectroscopic detection.

95 **3.2.S.5 Reference Standards or Materials**

96 **Q): What information should be submitted to validate primary and secondary reference**
97 **standards?**

98 **A):** A primary reference standard other than a compendial standard should be highly purified and
99 fully characterized. All data supporting structure elucidation, strength and purity should be
100 submitted. A certificate of analysis should also be submitted with purity assigned based on mass
101 balance.

102 Secondary reference standards [working standards, house standards] should be prepared
103 similarly to the primary reference material and standardized against the compendial reference
104 standard or primary reference standard. Secondary reference standard should be fully
105 characterized as to identity (IR and UV spectra should be submitted for both the primary and
106 secondary reference standards run concomitantly) and purity, and copies of CofA should be
107 provided.

118 In all cases, all purification steps used to further purify samples taken from a pilot or commercial
119 batch for the purpose of generating a reference standard should be described.

120

121 **3.2.P Drug Product**

122

123 **3.2.P.2 Pharmaceutical Development**

124

125 **Q): What is the significance of f2 while comparing dissolution test results?**

126

127 **A):** Calculation of similarity factor, f2, is recommended to compare dissolution profiles from
128 solid dosage forms (e.g., tablets, capsules) to establish in vitro similarity between different test
129 samples of the same product. This comparison could be used to support a request for waiver of
130 performing bioequivalence study.

131

132 An f2 value between 50 and 100 suggests the two dissolution profiles are considered similar. If
133 the f2 values are below 50, an investigation should be initiated to determine the cause of
134 apparent dissimilarity. Scientific explanation and alternative data may be considered on a case by
135 case basis.

136

137 **3.2.P.3 Manufacture**

138

139 **Q): Is it necessary for analytical testing facilities to meet GMP requirements?**

140

141 **A):** Yes. Analytical tests performed by any facility must be compliant with Good Manufacturing
142 Practices (GMP) requirements of Division 2 under the *Food and Drug Regulations*. This
143 requirement is applicable to all Canadian distributors and importers engaged in the sale of a drug
144 (as described in C.02.003) who either have their own testing facility or rely upon the services of
145 another testing facility for evaluation of raw material (C.02.009), packaging material (C.02.016)
146 finished product (C.02.018), and stability (C.02.028).

147

148 **Q): What is the requirement in the pre-approval stage, in the way of data to support
149 transportation of drug product intermediates and bulk dosage forms from one facility to
150 another for final processing and/or packaging in the market container?**

151

152 **A):** It should be noted that the HPFB Inspectorate's *GMP Guideline and Guidelines for*
153 *Temperature Control of Drug Products during Storage and Transportation* provides guidance
154 for transportation requirements for drug product in its final market container. However, at the
155 pre-approval stage an assessment is needed of the transportation conditions of drug product
156 intermediates (e.g., granules, coated pellets) and bulk dosage forms (e.g., bulk tablets, bulk
157 solutions), which are transported from one manufacturing facility to another for additional
158 processing and/or packaging in the final market containers.

159

160 Data required to support transportation of finished product intermediates and bulk dosage forms
161 will vary, depending on the nature of the intermediate or bulk product and the mode of
162 transportation. Transportation studies should consider conditions likely to be encountered during
163 transportation, including exposure to elevated and depressed temperature and humidity, and
164 reduced atmospheric pressure (such as might be encountered during air transportation), and
165 physical stresses associated with vibration and impact. The pre-market submission should
166 include results of, or a detailed protocol for, transportation studies, and may include tests
167 conducted on actual shipped samples, or on samples subjected to simulated transportation
168 conditions. Product characteristics which should be considered include, but are not limited to the
169 following:

170

- 171 • assay and degradation products (all intermediates and bulk drug products)
- 172 • precipitation of dissolved solutes for solutions
- 173 • phase separation of multi-phase (disperse) systems
- 174 • settling of fines in powders and granules
- 175 • friability of tablets or granules
- 176 • container/closure integrity (e.g., liquid preparations subjected to reduced pressure).
- 177 • any other stability/performance indicating test specific to the particular drug product type

178 The transportation studies should be adequate to support conclusions regarding selection of
179 appropriate bulk packaging materials, mode(s) of transportation, necessary controls on shipping
180 conditions, and maximum hold times.

182

183 **Document Change Log**
