	<u>A specific catch-up program is currently underway.</u> A catch-up program is defined as a time-limited measure to implement a new vaccine program to a certain age cohort (e.g. an additional dose of a vaccine is recommended and a targeted program is put in place). It can also be used when a vaccine is added at a younger age (e.g. in infancy) and the existing program continues until that infancy age cohort “catches up” to the current age cohort (e.g. hepatitis b vaccine is added to the infancy program, but the school immunization program continues until those infants reach school aged immunization). With that said, a province or territory can still provide catch-up vaccine at the individual level even if there’s no specific program in place.
