Vaccination is one of the most effective ways to protect yourself from COVID-19. Evidence shows that vaccines developed under strict supervision in Canada are highly effective at preventing COVID-19, hospitalization, and death.

Booster doses, as well as the latest information about vaccination, are important for keeping up your protection against COVID-19. As time passes, the effectiveness of vaccines decreases. Booster doses help remind your immune system that it needs to be prepared to fight off COVID-19 if you are exposed. This helps keep your health system healthy, reduce the risk of severe illness, and reduce the spread of COVID-19.

COVID-19 booster doses can provide some protection, but they are also currently the most effective way to keep up your protection against COVID-19. After you get vaccinated, you should be updated on the latest information. If you need to contact your local health authority, you can call them.

COVID-19 is a major public health issue in the world. People are developing symptoms after vaccination, but they are mild compared to COVID-19. This is why it is so important to keep up your vaccination and follow public health guidelines. People should continue to wear masks, practice social distancing, and get tested when needed.

COVID-19 vaccines are available in Canada. You can get more information on Canada.ca/covid-vaccine.
