Subject: CEAA improvements

With all the ideas to improve the environment through a very robust re-evaluation of the regulations, we feel totally exposed to the obvious environment attacks which are happening in our region.

Over the years, we have noticed an air born pollution which is most noticeable in winter. Our trapper members and families used to be able to use snow to cook with and make hotinks while in the forests of our region, but not any more.

There is a black speck of sorts which is very abundant on and in the snow----obviously an air born pollution which means we now have to carry filtered water with us wherever we go. Also, there are reports of a very small plastic bead which is becoming quite abundant on the bottom of our great lakes. It seems that this is a by product of tooth paste, but the alarm about what this may do to the aquatic life and up through the food chain, has us concerned. Meetings and more meetings will not fix this problem----physical action is needed----now. Thanks for the opportunity to express our community's concern!
